Séhane Bel Houari-Dourand (ENS Lyon) , Eduard Eiben Polynomial Kernel and Incompressibility for Prison-Free E

STACS 2025

A kernelization for a parameterized problem P is an algorithm that:

- **1** Reads an instance (I, k) of P, parameter k
- **2** Runs in time poly(|I| + k)
- 3 Outputs (I', k') where  $|I'|, k' \le f(k)$ , mapping YES-instances to YES-instances and NO-instances to NO-instances

P has a polynomial kernel if there is a kernelization with f(k) = poly(k)

### *H*-Free Edge Editing (Deletion, Completion)

Given (G, k), change (delete, add) k edges of G so that G has no induced copy of H

2/13

A kernelization for a parameterized problem P is an algorithm that:

- **1** Reads an instance (I, k) of P, parameter k
- **2** Runs in time poly(|I| + k)
- 3 Outputs (I', k') where  $|I'|, k' \le f(k)$ , mapping YES-instances to YES-instances and NO-instances to NO-instances

P has a polynomial kernel if there is a kernelization with f(k) = poly(k)

#### *H*-Free Edge Editing (Deletion, Completion)

Given (G, k), change (delete, add) k edges of G so that G has no induced copy of H

Н	Graph class	Kernelization result	
$P_3$	Cluster graph	PK (Gramm, Guo, Hüffner, Niedermeier 2005)	
$P_4$	Cographs	PK (Guillemot, Havet, Paul, Perez 2014)	
$K_d$	-	PK (folklore)	
$\mathcal{C}_\ell$ , $\ell \geq 4$		No PK (Cai, Cai 2015)	
$P_\ell$ , $\ell \geq 5$		No PK (Cai, Cai 2015)	

If the graph class is sufficiently restricted, H-free Graph Modification can have a polynomial kernel

For most graphs, *H*-free graphs have no significant structure and no polynomial kernel

Н	Graph class	Kernelization result	
<i>P</i> <sub>3</sub>	Cluster graph	PK (Gramm, Guo, Hüffner, Niedermeier 2005)	
$P_4$	Cographs	PK (Guillemot, Havet, Paul, Perez 2014)	
$K_d$	-	PK (folklore)	
$C_\ell$ , $\ell \geq 4$		No PK (Cai, Cai 2015)	
$P_\ell$ , $\ell \geq 5$		No PK (Cai, Cai 2015)	

If the graph class is sufficiently restricted, H-free Graph Modification can have a polynomial kernel

For most graphs, *H*-free graphs have no significant structure and no polynomial kernel

Н	Graph class	Kernelization result
$P_3$	Cluster graph	PK (Gramm, Guo, Hüffner, Niedermeier 2005)
$P_4$	Cographs	PK (Guillemot, Havet, Paul, Perez 2014)

$\mathcal{C}_\ell$ , $\ell \geq 4$		No PK (Cai, Cai 2015)
$P_\ell$ , $\ell \geq 5$		No PK (Cai, Cai 2015)

If the graph class is sufficiently restricted, H-free Graph Modification can have a polynomial kernel

For most graphs, H-free graphs have no significant structure and no polynomial kernel

### Cai, Cai, 2015

For any 3-connected graph H:

- H-Free Edge Editing and H-Free Edge Deletion have no polynomial kernels unless H is a clique
- *H*-Free Edge Completion has no polynomial kernel unless *H* is  $K_d$  or  $K_d e$

## Conjecture (Marx and Sandeep, 2022)

If H has at least five vertices, then

- *H*-Free Edge Editing has a polynomial kernel only if H is a clique or empty
- *H*-Free Edge Deletion has a polynomial kernel only if H is a clique or has at most one edge

It suffices to verify this for a finite set of 19 graphs

## Sunflower lemma (consequence)

Let  $\mathcal{F}$  be a set family of sets of size d. There is a subfamily  $\mathcal{F}' \subseteq \mathcal{F}$  such that  $|\mathcal{F}| = O(k^d)$ and every set X,  $|X| \leq k$  that intersects every  $F \in \mathcal{F}'$  also intersects every  $F \in \mathcal{F}$ 

• Let  $\mathcal{F}$  contain all edge sets of induced prison in G

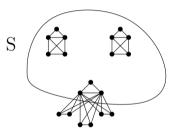

# Modulator

### Sunflower lemma (consequence)

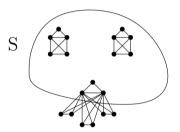

Let  $\mathcal{F}$  be a set family of sets of size d. There is a subfamily  $\mathcal{F}' \subseteq \mathcal{F}$  such that  $|\mathcal{F}| = O(k^d)$ and every set X,  $|X| \leq k$  that intersects every  $F \in \mathcal{F}'$  also intersects every  $F \in \mathcal{F}$ 

- Let  $\mathcal{F}$  contain all edge sets of induced prison in G
- Let  $S = V(\mathcal{F}')$ ; then  $|S| = O(k^8)$
- *G* − *S* is prison-free and *S* handles all prisons in *G*

### Reduction rule

If any prison has only one edge in S, delete that edge and decrease k

< 行

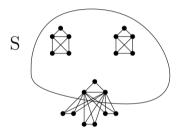

# Modulator

### Reduction rule

If any prison has only one edge in S, delete that edge and decrease k

### Reduction rule

If any edge e is not in S and not in a  $K_5$  or  $K_5 - e$ , discard e

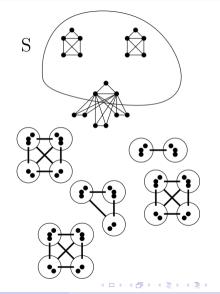

# Edge decomposition of G - S

## Edge decomposition

The edges of G - S partition into maximal induced multicliques

Hints:

- All edges occur in dense subgraphs with S (at least K<sub>4</sub>'s)
- Multicliques with ≥ 4 parts can't share edges without creating a prison

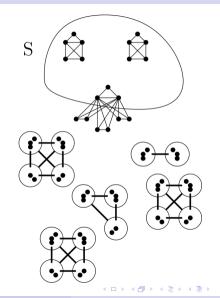

# Edge decomposition of G - S

## Edge decomposition

The edges of G - S partition into maximal induced multicliques

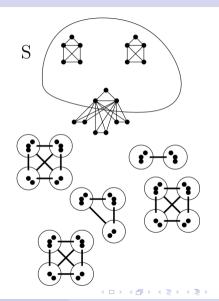

### Hints:

- All edges occur in dense subgraphs with S (at least K<sub>4</sub>'s)
- Multicliques with ≥ 4 parts can't share edges without creating a prison
- For every edge uv in S, N(uv) \ S is co-P<sub>3</sub>-free – a multiclique!

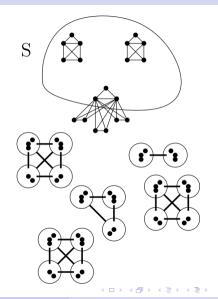

Every  $K_5$  or  $K_5 - e$  in G occurs inside  $F \cup S$ for some multiclique F of G - S

 Propagation: Deleting e in prison creates another prison, etc.

Every  $K_5$  or  $K_5 - e$  in G occurs inside  $F \cup S$ for some multiclique F of G - S

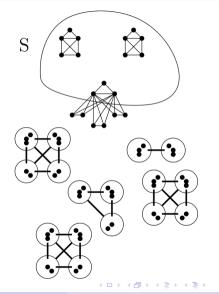

- Propagation: Deleting e in prison creates another prison, etc.
- That only happens if e is in K<sub>5</sub> or K<sub>5</sub> e in G

# Propagation

Every  $K_5$  or  $K_5 - e$  in G occurs inside  $F \cup S$ for some multiclique F of G - S

- Propagation: Deleting *e* in prison creates another prison, etc.
- That only happens if e is in K<sub>5</sub> or K<sub>5</sub> e in G
- No propagation multicliques act independently

- Prison-Free Edge Deletion has a polynomial kernel
- Prison-Free Edge Completion does not (see paper)

# Summary

## Conjecture (Cai and Cai, 2015)

If H is 2-connected with at least six vertices, then

- H-Free Edge Editing has a polynomial kernel only if H is a clique
- *H*-Free Edge Deletion has a polynomial kernel only if H is a clique
- *H*-Free Edge Completion has a polynomial kernel only if H is missing at most one edge
- Prison-Free Edge Deletion has a polynomial kernel
- Prison-Free Edge Completion does not (see paper)
- Open 1: Prison-Free Edge Editing?
- Open 2: Is the conjecture of Cai and Cai true?
